Transponder and appliance

The invention relates to a transponder provided with an integrated circuit, an antenna, and a first capacitor provided with a dielectric and a first and a second capacitor electrode, which transponder comprises a stack of layers, i.e.:

- a first layer of a dielectric material,
- 5 - a first patterned electrically conductive layer of which the antenna forms part,
- a second layer of a dielectric material, and
- a second patterned electrically conductive layer.

The invention further relates to an appliance provided with a transponder which comprises an integrated circuit, an antenna, and a first capacitor.
